

# Prius PHV

## *First-Year Report*

### Real-World Data

Many years ago, there was much doubt about hybrids, those cars with both a combustion engine and an electric motor. Fortunately, most of the misconceptions from back then have since been proven false and forgotten, no longer impairing the spread of the cleaner and more efficient technology. Even the implied stigma from those hoping to undermine progress has faded. It's now common to see hybrids every time you drive... so common, the next step has been taken by automakers: the introduction of a plug.

Full hybrids (like Prius) utilize a power-split device. This delivers the ability to vary the power & direction of energy by connecting a motor for traction, a motor for generating electricity, and an engine. The flexibility provides a wide array of behavior which can rapidly change from one mode to another. That means being able to both create & consume electricity at the same time, resulting in a very efficient way of using it for propulsion and recharging the battery-pack. Adding a plug increases efficiency opportunities.

As with regular hybrids, success depends upon real-world data. Automakers advertisements cannot convey the complexities & expectations of ownership. Owners can. Their endorsements are a powerful tool for educating & informing. This document supplies detail of owning a 2012 Prius PHV, the plug-in model.

*Note:* Standard household outlets, the common 110/120 volt connection we all have in our homes, is all that's needed for recharging Prius PHV. From "empty" (battery-pack level of about 23%) it will take 2.5 hours to recharge to "full" (battery-pack level to 85%). A faster 220/240 volt connection is available. It reduces recharge time to 1.5 hours. But the extra expense of purchasing that faster charger isn't necessary. The 110/120 included with purchase is all owners recharging overnight will ever need.

## Annual Totals

The following are the totals, spanning from March 11, 2012 to March 10, 2013:

**18,477** Total Miles

**6,328** EV Miles (displayed amount)

**12,123** HV Miles (displayed amount)

**365** Days (12 months)

**574** Recharges (based on capacity replenished)

**239.9** Total Gallons (measured at the pump)

**1,721** Total kWh (including charging losses)

**1,505** Total kWh (displayed amount)

**77.0** Lifetime MPG

**50.5** MPG (HV)

**27** kWh / 100 miles

Those numbers in the summary are from an owner in Minnesota, where extreme cold temperature driving reduces efficiency in all types of vehicles. Driving roughly 19,000 miles per year is another above average factor to consider. The few miles you drive, the higher MPG can be. More electricity usage translates to better efficiency. This is true even when the engine runs. That means HV miles benefit from having plug-supplied electricity available too.

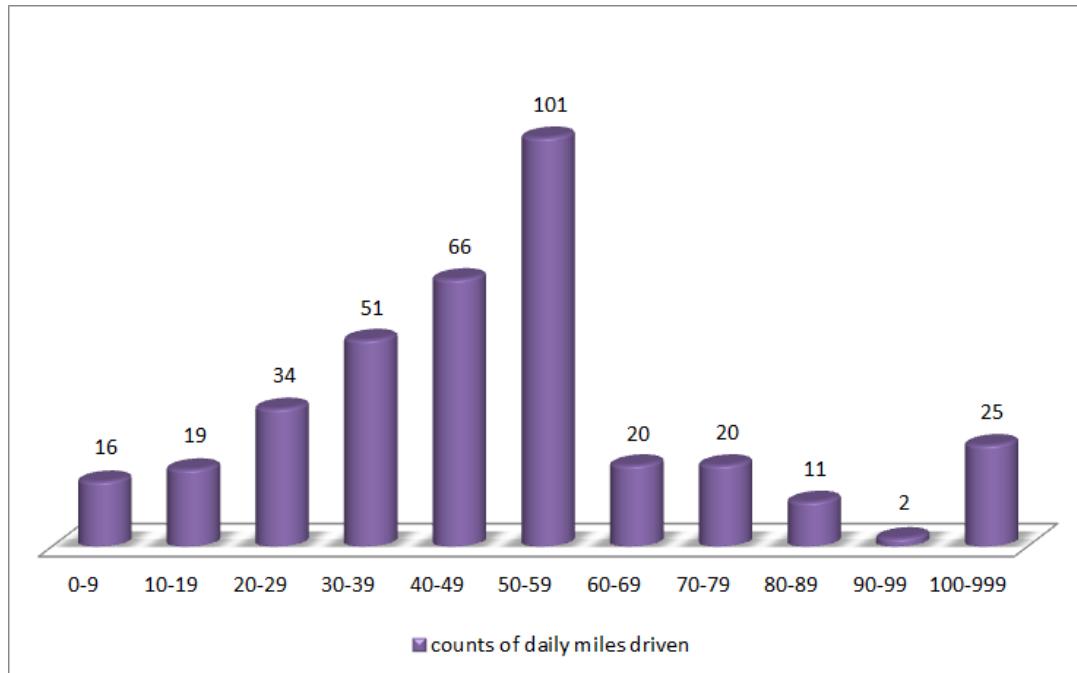

Each owner's driving circumstances are different. This is why the window-sticker always comes with a YMMV (Your Mileage May Vary) warning. With the case of a plug being included, change that "May" to a "Will". Nonetheless, real-world data is still an important means of measuring the effectiveness of the technology.

What is clear though is the efficiency improvement the larger battery-pack and plug provide. The resulting MPG is well above what a regular Prius would deliver.

*Note:* With the owner data above, it is important to be aware that a charging-station was available at work and was used most afternoons prior to the commute home. The commute itself was about 34 miles round-trip. Lots of other driving during evenings and on weekends also took place. Shorter commutes, less frequent driving, or not recharging a second time daily would result in different MPG.

## Daily Miles - Summary

Don't be fooled by generalized estimates claiming standard daily-driving quantities. Most people assume they follow a routine. You'd be surprised how often the demands of life cause unpredictable variation. There usually isn't a pattern to the driving. This real-world data clearly shows that:

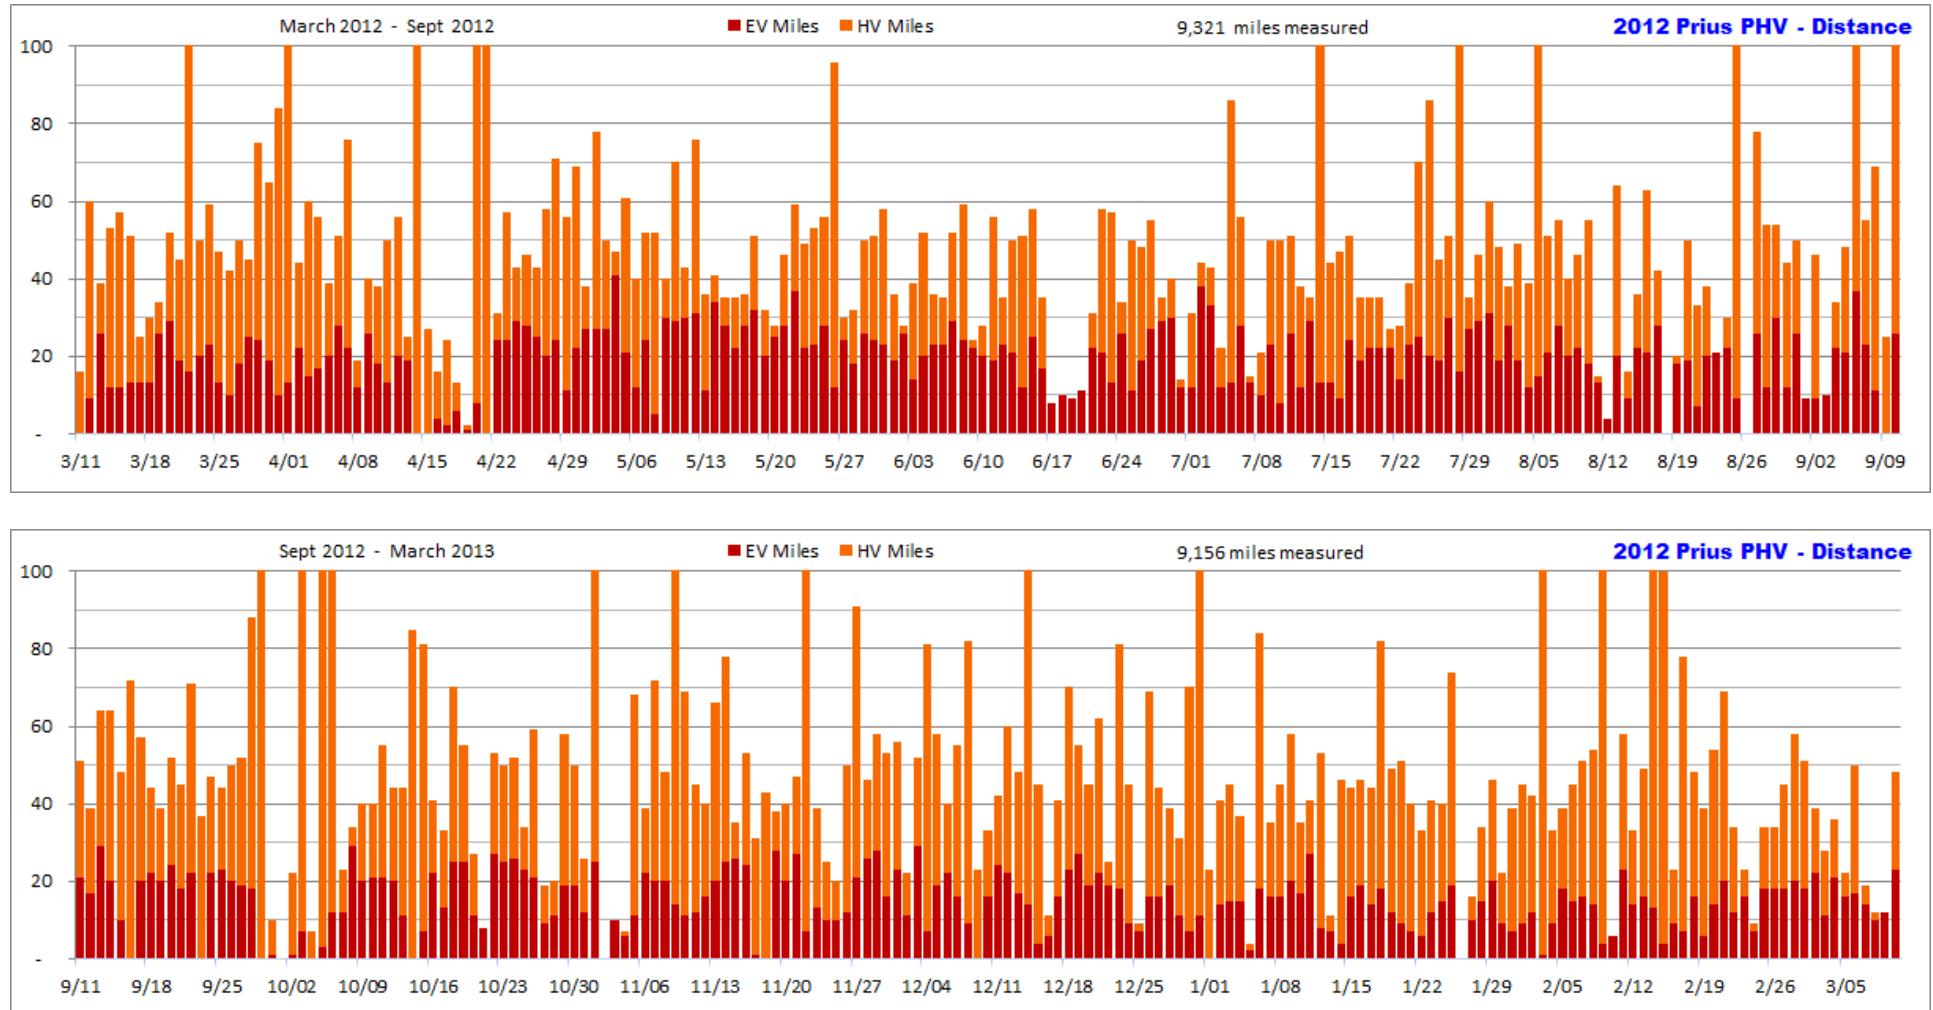

Think about how often you run to the store for household items, buy groceries, meet a friend, visit family, go to a theater, eat at a restaurant, get a coffee, pick up a prescription, rent a movie or game, go to the bank, have late night food cravings... the list of possible non-work driving you could routinely do is extensive. That doesn't even include any of the running around you do for your children.

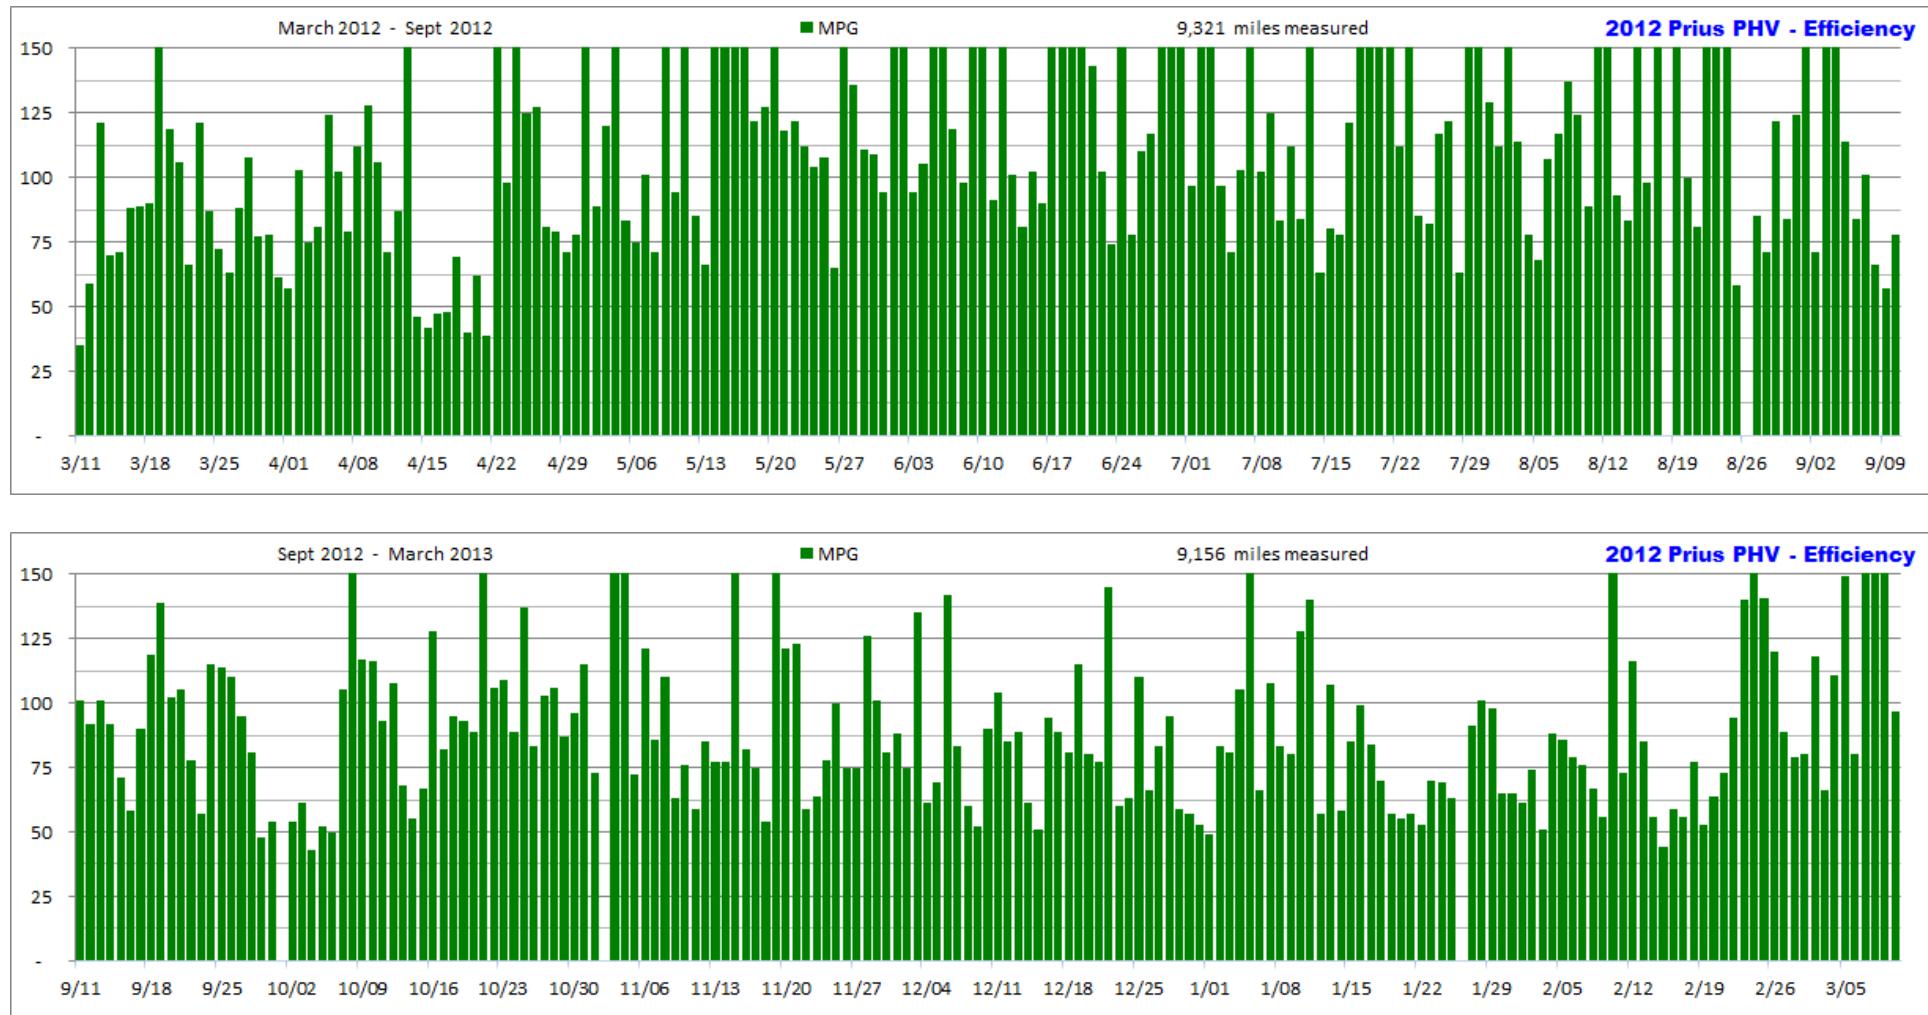

## Daily Miles - Detail

That cliché pointing out “*the devil is in the detail*” most definitely applies when it comes to a plug-in hybrid like Prius. Use of the plug-supplied electricity varies greatly, even when consistently charge once or twice per day. It’s very important to remember that when miles are not logged as EV, the miles in HV still take advantage of the battery-pack.

Notice the variation. The lack of any pattern becomes quite evident when the real-world data is plotted in a daily graph like these:

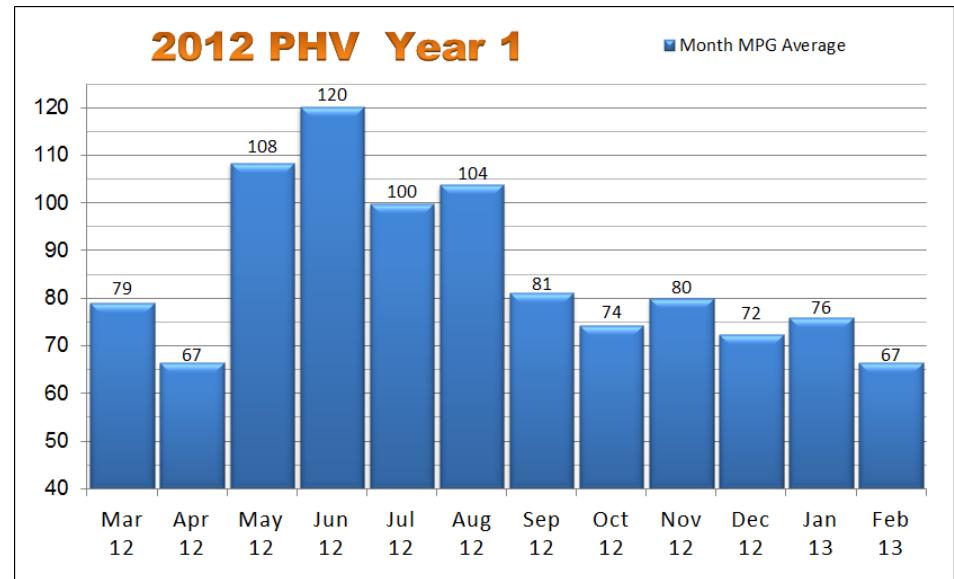

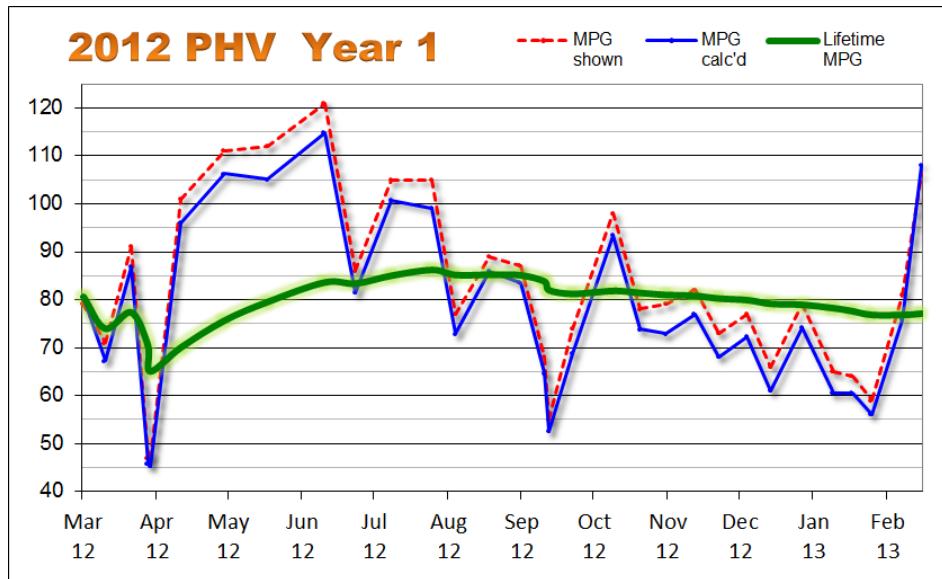

Coinciding with the EV & HV mile data is the detail for MPG. Each day varies widely, which is very easy to see:

The benefit of the plug and larger battery-pack is obvious. Notice that most days are well the 50 MPG mark.

## Tank Efficiency - Summary

Based on **gas consumption** and **total miles driven**, these graphs are 2 different ways of showing the efficiency results, per tank & per month:

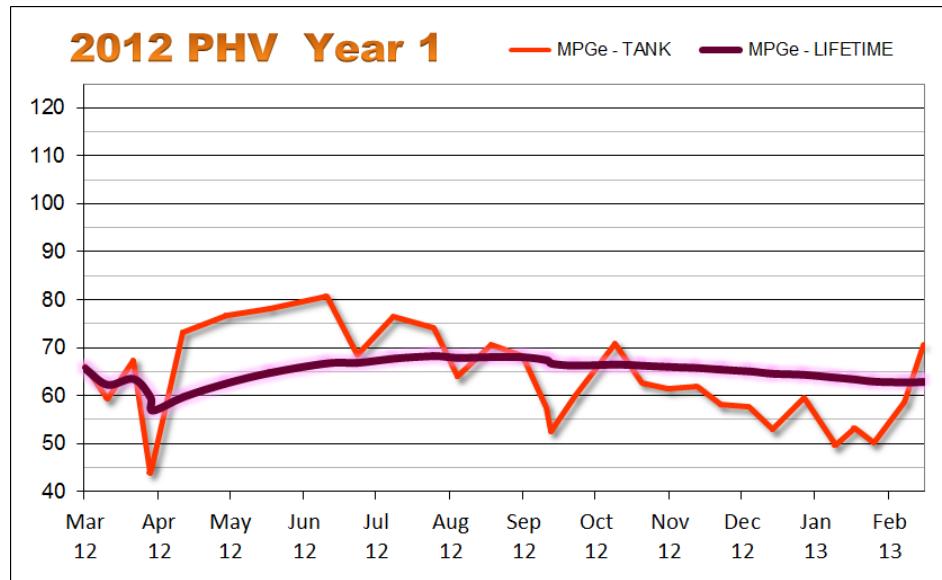

In both, you can clearly see the variation caused by season change. Many factors influence the outcome. But even without know how & why detail, it's easy to confirm the same type of up & down with traditional vehicles applies to the hybrid as well. Fortunately, the resulting MPG itself is quite a bit better.

Notice that green line in the “per tank” graph on the left? That’s the lifetime MPG value. It’s a running total illustrating the overall average taking the entire year’s worth of data into account. This is what ultimately informs the owner of what their particular gas consumption level is for ownership of the vehicle.

Combining gallons of gas with kWh of electricity results in a new type of efficiency measure, called “**MPGe**”.

Notice how different it appears compared to just gallons of gas alone:

The purpose is to take all forms of energy into account, conveying a complete picture of efficiency.

This is the formula used:  $\text{MPGe} = (\# \text{ EV miles} + \# \text{ HV miles}) / ((\# \text{ kWh} / 32.6 \text{ kWh}) + \# \text{ gallons})$

*32.6 kWh represents the electrical equivalent of one gallon of E10*

*33.7 kWh represents the electrical equivalent of one gallon of 100% gas*

*kWh value from the real-world data must include charging losses.*

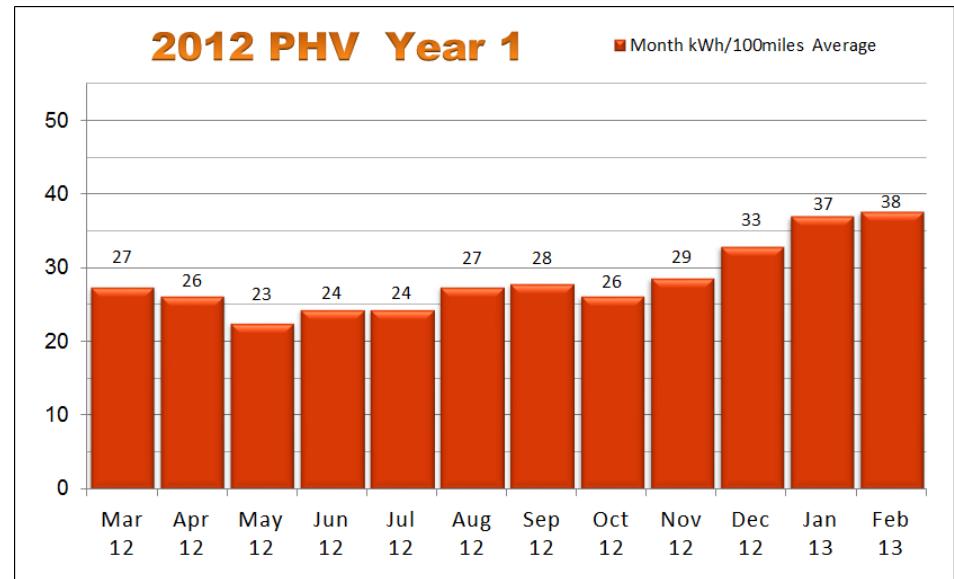

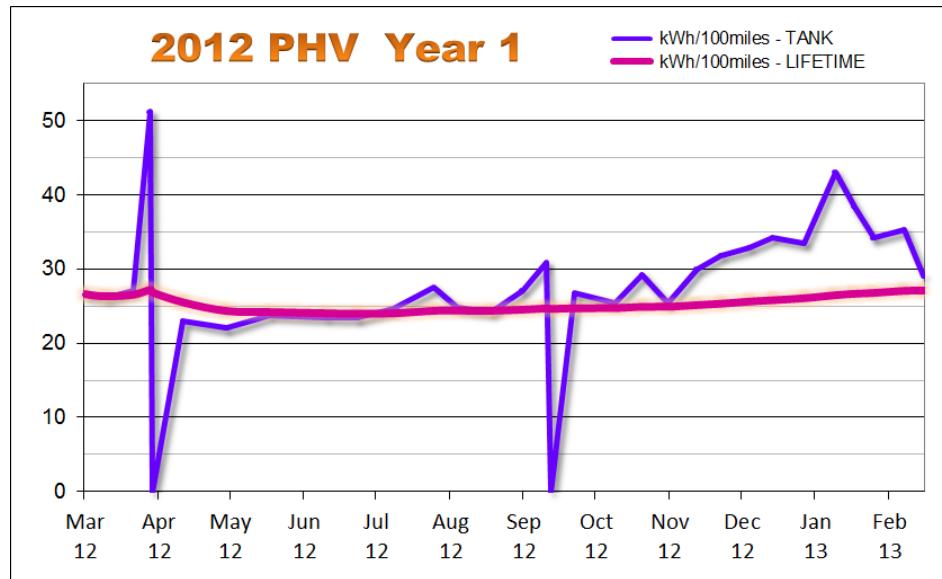

## Tank Efficiency - Detail

These are the values documented each time the gas tank was refilled. Notice the difference between shown (computer displayed) quantities and the pump & outlet measurements. Study closely the relation between electricity (kWh) & gas (gallons), how they influence efficiency results. Don't forget about season influence either. The real-world data is far from the simple estimates people assume and those greenwashers attempt to convince you of.

	MPG shown	MPG calc'd	Lifetime MPG	EV	HV	Total Miles	Gallons	Total Gallons	Recharges	kWh shown	kWh calc'd	Total kWh	MPG (HV)	kWh / 100 miles	Lifetime kWh/100m calc'd

## Plug Efficiency - Summary

Based on **electricity consumption** and **EV miles driven**, these graphs are 2 different ways of showing the efficiency results, per tank & per month:

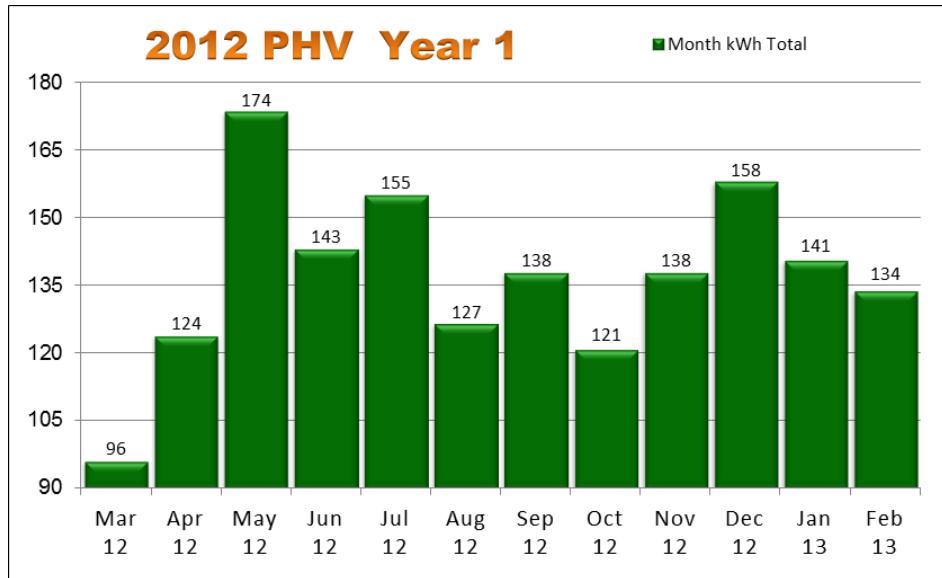

The purpose of this information is to give a general idea of the efficiency coming from the traction motor specifically. It documents electricity usage only. This is why only the EV miles are used in the calculations, not overall miles which would also include HV miles.

The unit of measure for this is "**kWh/100miles**", indicating the quantity of electricity it takes to travel 100 miles. This is very different from the efficiency MPG measures.

*Note:* When tank data on the graph drops all the way to zero, that indicates driving was done without plugging. For example, a road-trip was taken without outlet or recharger access available.

## Plug kWh - Summary

This particular graph visually depicts the quantity of electricity consumed per month, in units of kWh:

Don't forget that the recharging process itself consumes electricity. This is known as "*charging loss*". Some sources of electricity consumption only report the kWh extracted from the battery-pack, excluding the loss. Not accounting for that extra electricity is very misleading.

Prius PHV has a 4.4 kWh size battery-pack. Approximately 62% is used for EV miles. That translates to roughly 2.75 kWh being used for EV travel when that entire available capacity is used. 3 kWh is how much owners typically observe from meters measuring the quantity of electricity used to replenish that capacity while recharging.

## Month - Detail

Some of the prior graphs originated from the calculation results found in this matrix:

	MPG	Miles	Gallons	kWh	kWh/100m
Mar - 12	79.1	1,100	13.915	96.0	27.4
Apr - 12	66.5	1,828	27.481	123.9	26.2
May - 12	108.4	1,546	14.261	173.7	22.6
Jun - 12	120.2	1,161	9.659	143.1	24.5
Jul - 12	99.8	1,594	15.978	155.1	24.4
Aug - 12	103.9	1,570	15.111	126.6	27.5
Sep - 12	81.1	1,691	20.846	138.0	27.9
Oct - 12	74.3	1,679	22.589	120.9	26.3
Nov - 12	80.0	1,565	19.557	138.0	28.7
Dec - 12	72.4	1,647	22.754	158.1	33.0
Jan - 13	75.9	1,291	17.012	140.7	37.0
Feb - 13	66.6	1,477	22.182	133.8	37.7
Mar - 13	100.8	328	3.255	49.5	30.2
TOTAL	82.3	18,477	224.600	1,697.4	28.2

That monthly detail was based upon the real-world daily data collected as well as the values documented each time the gas tank was refilled.

## Daily - Detail

The following are real-world owner log entries, the complete collection of daily detail that was used to create the summary & graphs:

Date	ODO	MPG	Charges	EV	HV	calc'd gallons	tank gallons
